

# A Poor Man's Student's Guide to Trigonometry

---

Trigonometric Functions (just ratios with fancy names)

Triangles & Rotation & Oscillations: motions are related

We will use the Trig functions when working with \_\_\_\_\_ triangles.

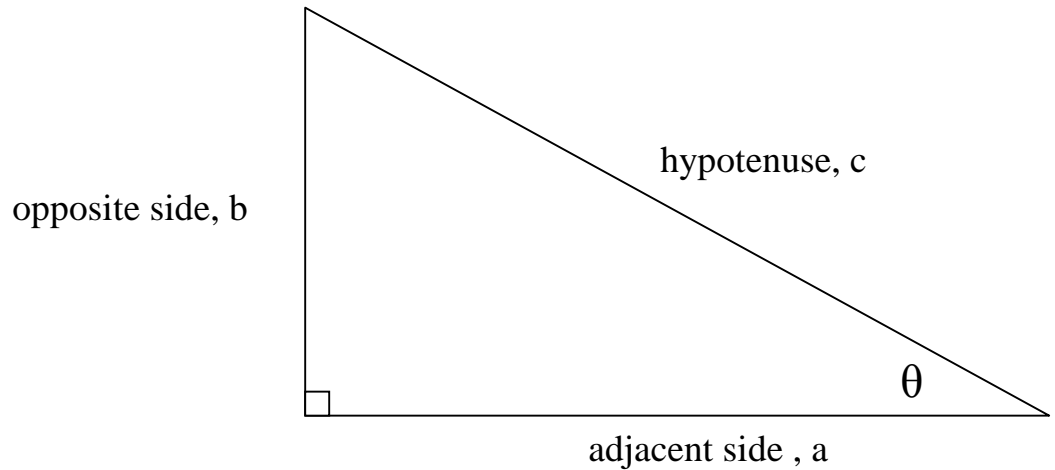

Pythagorean Th<sup>m</sup>:  $a^2 + b^2 = c^2$   
Is true only for \_\_\_\_\_ triangles.

Ex:

There are a few important ratios that are given fancy names:

The sine of  $\theta$ :  $\sin \theta = \frac{op}{hyp}$

The cosine of  $\theta$ :  $\cos \theta = \frac{adj}{hyp}$

The tangent of  $\theta$ :  $\tan \theta = \frac{op}{adj}$

$\sin\theta$ ,  $\cos\theta$ ,  
and  $\tan\theta$  are  
all just  
ratios of  
two sides.

For the triangle we just had:

The sine of  $\theta$ :  $\sin \theta = \frac{op}{hyp} = \frac{3 \text{ feet}}{\sqrt{13} \text{ feet}} = 0.832$

The cosine of  $\theta$ :  $\cos \theta = \frac{adj}{hyp} = \frac{2 \text{ feet}}{\sqrt{13} \text{ feet}} = 0.555$

The tangent of  $\theta$ :  $\tan \theta = \frac{op}{adj} = \frac{3 \text{ feet}}{2 \text{ feet}} = 1.5$

We can use these ratios to find the angle  $\theta$ .

We had  $\sin \theta = 0.832$

Now we have to find the angle whose sine ( "whose ratio of  $op/hyp$ " ) is 0.832.

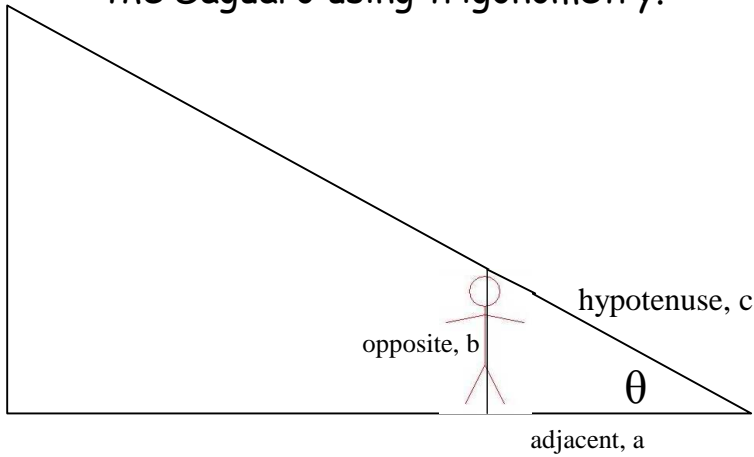

This is done on your 

You would write:  $\theta = \sin^{-1} 0.832$

This is read: " $\theta$  equals the inverse sine of 0.832".

Now use your calculator to find  $\theta = 56.3^\circ$ .

Ex: Let's find the height of the Saguaro using trigonometry.

In the above picture:

I measured  $a = 50$  inches, and  $b = 67$  inches.

Use the Pythagorean Th<sup>m</sup> to solve for  $c$ :  $c = \sim 84$  inches.

Now pick one of the trig functions to find  $\theta$ .

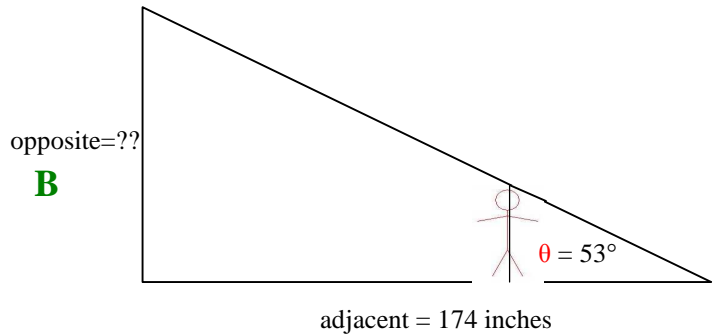

$$\sin \theta = \frac{op}{hyp} \quad \text{so } \sin \theta = \frac{67 \text{ inches}}{84 \text{ inches}} = 0.80$$

$$\text{so } \sin \theta = 0.80, \text{ and } \quad \theta = \sin^{-1} 0.8$$

and we get  $\theta = 53^\circ$ .

So what's the height of the cactus???

I also measured this bottom length to be 14.5 feet, or 174 inches.

We know: 1) the angle  $\theta$   
2) an adjacent side,  
and we want to find the *opposite* side **B** (that's the height of the cactus).

So which trig function should we use?

$$\sin \theta = \frac{op}{hyp}$$

$$\cos \theta = \frac{adj}{hyp}$$

$$\tan \theta = \frac{op}{adj}$$

$$\tan \theta = \frac{op}{adj}$$

$$\tan 53^\circ = \frac{B}{174inches}$$

Solving this for the opposite side gives:

$$B = 174 \text{ inches} * \tan 53^\circ$$

$$B = 231 \text{ inches} = 19 \frac{1}{4} \text{ feet.}$$

Let's find the distance  $c$ .

We could use Pythagorean Th<sup>m</sup> or Trig.

$$\sin \theta = \frac{op}{hyp} \quad \cos \theta = \frac{adj}{hyp} \quad \tan \theta = \frac{op}{adj}$$

$$1. \sin \theta = \frac{op}{c} \quad \text{so} \quad c = \frac{op}{\sin \theta} \quad c = \frac{19.25 \text{ ft}}{\sin 53^\circ} \quad c = 24.1 \text{ ft}$$

or

$$2. \cos \theta = \frac{adj}{c} \quad \text{so} \quad c = \frac{adj}{\cos \theta} \quad c = \frac{14.5 \text{ ft}}{\cos 53^\circ} \quad c = 24.1 \text{ ft}$$

Again, we could have used the Pythagorean Th<sup>m</sup> to find  $c$ ,  $a^2 + b^2 = c^2$ ,

but if only the angle  $\theta$  and one side is known, we *have* to use trigonometry.
